Evocon: Operator reports
Project proposal

Who we are?
Evocon helps production companies digitize their production process and gives them a solution for smart decision-making. Our cloud-based service provides manufacturers with the tools necessary to manage and improve production efficiency. This is achieved by enabling automated production tracking and monitoring in real-time and collecting data on important manufacturing indicators.

Evocon is a fast growing company based in Estonia and our service is being used in over 15 countries covering over 70 different production sites.

Project description
The objective of the project is to develop a prototype for the “Operator reports” module that will serve as proof of concept in establishing ways of engaging the factory floor personnel of production companies.
All production efficiency software solutions concentrate on the technical capability of machines but miss the people aspect. Since people are the ones operating production machines it is vital for them to be engaged in order to reach higher efficiency levels. With “Operator reports” Evocon wishes to engage factory floor employees and help customers build a stronger organizational culture around increasing production efficiency and reducing waste.
A more detailed project scope will be given at first meeting.

Technical overview
Since our project is front-end oriented, we expect basic knowledge of JavaScript and HTML5, other technologies will be introduced in the process.

Expected outcome
We expect the outcome in 2 stages:
• First stage - detailed specifications based on the requirements we provide.
• Second stage - initial working prototype - proof of concept - that will be tested in production.

Terms
Any outcomes produced by the student team under and within the framework of the Software Project and any transferable intellectual property rights related thereto, incl. all the economic rights of the author and rights to protect intellectual property are transferred to Evocon OÜ from the moment of creating them.
