Library app

The client is Tartu Linnaraamatukogu (Tartu City Library).
The aim of the project is to create an application for the public that will

- provide a simple way for pupils (or their parents) to find books on the child’s compulsory reading list;
- provide functionality for readers to get book recommendations based on different criteria

In addition, the library workers must be provided a webbrowser application to add books to the compulsory reading list, and also perform operations related to the recommendation engine (such as mark some books as „important“ so they would have a higher ranking in the results, and add keywords to books).
The app must connect to the existing library database, and take book data from there.

The application should cover the children’s section of the Annelinn’s branch of Tartu City Library (if possible then the coverage area should be expanded).

The app should be available for Android (if possible, then iOS also).

More specific details will come after discussion between the developers and the client.
