PROJECT DESCRIPTION

Subject: Decision Register
Author: A. van Geest
Date: August 29, 2017

What
Provide a simple way for decentralised teams to take decisions and built a smart register of the decisions taken.

We envision a solution were team members can use an app on their smart device to take decisions together. For example while being on a Skype call, the app displays the current decision to be taken to all participants. Every participant can select Vote for/ Against or No vote and the votes are being registered. The results can immediately be displayed back to the participants.

Timing, logging and security are crucial in this solution. A more detailed description of the entire idea of the solution is available upon request.

Why
Decision making is a huge problem for teams, especially if they are geographically dispersed. So we would like to make the process of decision making more convenient.

Secondly project teams often struggle to keep a good register of decisions that are taken. We want to make these decisions more open and accessible so less time will be lost on discussions about decisions that are already made.

Audience
Professionals in any industry. Mostly well educated (Project managers, Team members, Managers, Board members).

Expected outcome
We would like to see:
- an Android based app with which it is possible to register votes on a decision.
- If possible we would also like to see a web interface for account management and also voting possibilities for those without a smartphone.

Constraints
- Security of the solution is imperative. No unencrypted exchange of information is allowed. Where possible users should be anonymised, etc.
- Use of reliable open source technology.
- We should be able to implement and run the developed solution on our own servers.

Conditions
We regard this project as a proof of concept for further development. We would like to retain the intellectual property rights. Or rights can be discussed.
