Exercise 7
Requirements Prioritisation

Tasks

1. Analyze the requirements in your requirements specification and determine:
   - Which requirements must be included in the final specification?
   - Which requirements should definitely be excluded from your requirements specification?
   - Which requirements would be nice-to-have in the final requirements specification?

2. Organize nice to have requirements to the requirements hierarchy.

3. Select one set (consisting of at least four requirements) of requirements. Apply the AHP method according to requirements value and implementation cost criteria.

Your solution should be provided as a part of the final requirements specification.

Submit your solution to the tasks (and the final requirements specification) using the course submission function no later than 8th of December (Thursday).
