What is requirements (engineering) process?

Structured set of activities which are followed to derive, validate and maintain a system requirements document.

Since very few organizations have explicitly defined and standardized RE process.

They simply define the result of the process, namely the requirements document.
What are the major activities?

1. Define a standard structure
2. Make a document easy to change
3. Uniquely identify each requirements
4. Define policies for requirements management
5. Define standard template for requirements description
6. Use language simply, consistently and concisely
7. Organise formal requirements inspection
8. Define validation checklist
9. Use checklist for requirements analysis
10. Plan for conflicts and conflict resolution
What are the major artefacts created during RE?

It provides guidance to the people involved.

Reduces probability that the activities will be forgotten about in the implementation phase.
