Lecture 15 summary

This week we have analysed the security patterns. During the lecture we have defined what is the "pattern" and "security pattern". Also we have looked to one security pattern taxonomy to see how different patterns could be grouped according to their particularities. Next we have considered the approach for security requirements elicitation from business processes (SREBP). The approach is used the security risk-oriented patterns. So we went through the example, on how these patterns could support definition of the security models and derivation of security requirements.

The workshop task includes application of the SREBP approach. The workshop task should be done by the group. Only one report should be submitted from the group. The reports could include 4 security models and the list security requirements derived using the five SRPs. The deadline for submission is Tuesday (23.May).
