This week we have started to analyse separate components of the security domain. More specifically we looked at the functional aspects of the system assets and learnt about the taxonomy for system asset functional decomposition.

Then we moved to the security risk analysis. We travelled to the seven pernicious kingdoms, explored the profile of the threat agent and overviewed the taxonomy of the security threats. We have also looked at the major types of the malware.

As for your exercise, I am looking forward for your definitions of the security risks for the given football federation example. If you participated in the practicals, please define additional 3-4 security risks (if you did not participate -- 4-5), and please address these risk regarding different system assets. Please use the taxonomies (for different concepts) presented during the lecture and practicals. Solution submission deadline -- Tuesday, 14 March.
