Applied Cryptography

Certificate Revocation List (CRL)
Online Certificate Status Protocol (OCSP)

University of Tartu

Spring 2020
Certificate validity

It may be required to invalidate (revoke) a certificate before its expiration.

Examples:
- Private key compromised or lost
- Misissued certificate
- Data has changed
- Contract ended

Solution – Certificate Revocation List (CRL):

List of unexpired certificates that have been revoked by CA

- How can the relying party find the CRL?
- How is the integrity of CRL data assured?
- How frequently the CA should issue CRL?
- How frequently the relying party should refresh CRL?
- How can the relying party know that CRL is fresh?
Certificate Revocation List (CRL)

CertificateList ::= SEQUENCE {
tbsCertList TBSCertList,
signatureAlgorithm AlgorithmIdentifier,
signatureValue BIT STRING }

TBSCertList ::= SEQUENCE {
version Version OPTIONAL, -- if present, MUST be v2(1)
signature AlgorithmIdentifier,
issuer Name,
thisUpdate UTCTime,
nextUpdate UTCTime OPTIONAL,
revokedCertificates SEQUENCE OF SEQUENCE {
userCertificate CertificateSerialNumber,
revocationDate UTCTime,
crlEntryExtensions Extensions OPTIONAL -- in v2 } OPTIONAL,
crlExtensions [0] EXPLICIT Extensions OPTIONAL -- in v2 }

Certificate Revocation List (CRL)

- tbsCertList – DER structure to be signed by CRL issuer
- version – for v1 absent, for v2 contains 1
  - v2 introduces CRL and CRL Entry extensions
- signature – AlgorithmIdentifier from tbsCertList sequence
- issuer – identity of issuer who issued (signed) the CRL
  - CRL issued not by CA itself – indirect CRL
- thisUpdate – date when this CRL was issued
- nextUpdate – date when next CRL will be issued
- revokedCertificates – list of revoked certificates
  - userCertificate – serial number of revoked certificate
  - revocationDate – time when CA processed revocation request
  - crlEntryExtensions – provides additional revocation information
- crlExtensions – provides more information about CRL
Certificate chain

- How to validate a certificate chain?
- Where to look whether subject’s certificate is not revoked?
  - In CRL issued by intermediate CA (usually every 12h)
  - Grace period
- Where to look whether intermediate CA is not revoked?
  - In CRL issued by root CA (usually every 3 month)
  - Grace period?!
- Where to look whether the root CA is not revoked?
  - In CRL issued by root CA itself (flawed)

Who is liable for actions made after the root CA private key has been compromised?
Liability analysis

Let’s assume that subject’s private key has been compromised.

Who (subject, CA or relying party) is liable for actions made with the key:

• in the time period after revocation information has appeared in CRL?
• in the time period after CRL has been issued but not available to relying parties (e.g., CA server downtime)?
• in the time period before next CRL has been issued?
• in the time period before CA has marked the certificate revoked in their internal database?
• in the time period before CA has been informed about the key compromise?
Questions

- How can the relying party find the CRL?
- How is the integrity of CRL data assured?
- How frequently the CA should issue CRL?
- How frequently the relying party should refresh CRL?
- How can the relying party know that CRL is fresh?
- How to verify if root CA certificate has not been revoked?
- Is the subject liable for transactions made after certificate is revoked?
- Is the subject liable for transactions made in certificate validity period?
Online Certificate Status Protocol

CRL shortcomings:

• Size of CRLs
• Client-side complexity
• Outdated status information

“The Online Certificate Status Protocol (OCSP) enables applications to determine the (revocation) state of an identified certificate.”

• Where can the relying party find the OCSP responder?
• How is the certificate identified in the OCSP request?
• How is the integrity of OCSP response assured?
• How to ensure the freshness of OCSP response?
• How frequently certificate status should be checked?
## Authority Information Access

### Certificate Hierarchy

- DigiCert High Assurance EV Root CA
- DigiCert SHA2 High Assurance Server CA
- *.eesti.ee

### Certificate Fields

- Certificate Subject Key ID
- Certificate Subject Alt Name
- Certificate Key Usage
- Extended Key Usage
- CRL Distribution Points
- Certificate Policies

#### Authority Information Access

- Certificate Basic Constraints
- Certificate Signature Algorithm
- Certificate Signature Value

### Field Value

- Not Critical
- OCSP: URI: http://ocsp.digicert.com
- CA Issuers: URI: http://cacerts.digicert.com
- /DigiCertSHA2HighAssuranceServerCA.crt
OCSP over HTTP

Stream Content

POST / HTTP/1.0
Content-Type: application/ocsp-request
Content-Length: 120

HTTP/1.0 200 OK
last-modified: Wed, 07 Mar 2012 18:19:19 GMT
content-type: application/ocsp-response
content-transfer-encoding: binary
content-length: 1165
cache-control: max-age=514527, public, no-transform, must-revalidate
date: Thu, 08 Mar 2012 19:23:52 GMT
connection: close

Request syntax

OCSPRequest ::= SEQUENCE {
    tbsRequest TBSRequest,
    optionalSignature [0] Signature OPTIONAL }

Signature ::= SEQUENCE {
    signatureAlgorithm AlgorithmIdentifier,
    signature BIT STRING,
    certs [0] SEQUENCE OF Certificate OPTIONAL }

TBSRequest ::= SEQUENCE {
    version [0] Version DEFAULT v1(0),
    requestorName [1] GeneralName OPTIONAL,
    requestList SEQUENCE OF SEQUENCE {
        reqCert CertID,
        singleRequestExtensions [0] Extensions OPTIONAL }
    requestExtensions [2] Extensions OPTIONAL }

CertID ::= SEQUENCE {
    hashAlgorithm AlgorithmIdentifier,
    issuerNameHash OCTET STRING, -- Hash of Issuer's DN
    issuerKeyHash OCTET STRING, -- Hash of Issuer's public key
    (i.e., hash of subjectPublicKey BIT STRING content)
    serialNumber CertificateSerialNumber }
Response syntax

OCSPResponse ::= SEQUENCE {
    responseStatus OCSPResponseStatus,
    responseBytes [0] EXPLICIT ResponseBytes OPTIONAL }

OCSPResponseStatus ::= ENUMERATED {
    successful (0), --Response has valid confirmations
    malformedRequest (1), --Illegal confirmation request
    internalError (2), --Internal error in issuer
    tryLater (3), --Try again later
    --(4) is not used
    sigRequired (5), --Must sign the request
    unauthorized (6) --Request unauthorized
}

ResponseBytes ::= SEQUENCE {
    responseType OBJECT IDENTIFIER, --id-pkix-ocsp-basic
    response OCTET STRING }

• responseBytes provided only if responseStatus is “successful”
response ::= SEQUENCE {
  tbsResponseData ResponseData,
  signatureAlgorithm AlgorithmIdentifier,
  signature BIT STRING,
  certs [0] EXPLICIT SEQUENCE OF Certificate OPTIONAL }

ResponseData ::= SEQUENCE {
  version [0] EXPLICIT Version DEFAULT v1,
  responderID [1] Name,
  producedAt GeneralizedTime,
  responses SEQUENCE OF SEQUENCE {
    certID CertID,
    certStatus CertStatus,
    thisUpdate GeneralizedTime,
    nextUpdate [0] EXPLICIT GeneralizedTime OPTIONAL,
    singleExtensions [1] EXPLICIT Extensions OPTIONAL }
  responseExtensions [1] EXPLICIT Extensions OPTIONAL }

CertStatus ::= CHOICE {
  good [0] IMPLICIT NULL,
  revoked [1] IMPLICIT SEQUENCE {
    revocationTime GeneralizedTime,
    revocationReason [0] EXPLICIT CRLReason OPTIONAL }
  unknown [2] IMPLICIT NULL }
How to check the freshness of response?

• Check the signed timestamp (producedAt and thisUpdate)
  • What should be the allowed time difference?
  • Replay attacks
  • Reliance on the correctness of system clock
• Include nonce in the OCSP request and check it in the response
  • OCSP nonce extension (optional)
  • Prevents replay attacks
  • Vulnerable to downgrade attacks
Who signs OCSP response?

The key used to sign the response MUST belong to one of the following:

- CA who issued the certificate in question
- CA Authorized Responder who holds a specially marked certificate issued directly by the CA, indicating that the responder may issue OCSP responses for that CA
  - OCSP signing delegation SHALL be designated by the inclusion of `id-kp-OCSPSigning` flag in an `extendedKeyUsage` extension of the responder's certificate
  - How to check the revocation status of this certificate?
- Trusted Responder whose public key is trusted by the requester
  - Trust must be established by some out-of-band means
Revocation checking in browsers

• CRLs are not supported
• Problems with OCSP:
  • Privacy leakage
  • Slower initial page loading
  • Chrome uses OCSP only to check EV certificates (uses CRLSets)
  • Firefox is not brave enough to fail-safe:

• Solution is OCSP stapling (web server provides OCSP response to the browser)
• Shorter certificate validity period may help
• How frequently the OCSP status should be queried?
Questions

• Where can the relying party find the OCSP responder?
• How is the certificate identified in the OCSP request?
• How is the integrity of OCSP response assured?
• How to ensure the freshness of OCSP response?
• How frequently the validity status should be checked?
• What problem does the OCSP nonce extension solve?
• What is a downgrade attack?
Hypertext Transfer Protocol (HTTP)

- Application layer client-server, request-response protocol
- Runs over TCP (Transmission Control Protocol) port 80

Client request (http://example.com/hello):

```
GET /hello HTTP/1.1
Host: example.com
Connection: close
```

```
POST /hello HTTP/1.1
Host: example.com
Content-Length: 24
Connection: close
```

```
sending_this_binary_blob
```

Server response:

```
HTTP/1.1 200 OK
Date: Wed, 24 Mar 2020 19:35:42 GMT
Server: Apache
Content-Length: 7033
Content-Type: text/html
```

```
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Tran...>
```

- Header lines must all end with <CR><LF> (b"\r\n")
- Header lines are separated from the body by an empty line
- POST requests have a non-empty request body

Sockets in Python

```python
>>> import socket
>>> s = socket.socket(socket.AF_INET, socket.SOCK_STREAM)
>>> s.connect(("example.com", 80))
>>> s.sendall(b'GET / HTTP/1.1\r\nHost: example.com\r\n\r
')
37
>>> print(s.recv(20))
b'HTTP/1.1 200 OK\r\nAge'
```

- `recv()` returns bytes that are available in the read buffer
- `recv()` will wait if the read buffer empty (blocking by default)
- `recv()` will return 0 bytes if the connection is closed
- You must know how many bytes you must get
- Correct way to read HTTP response:
  - Read byte-by-byte until the full response header is received
  - Extract body size from `Content-Length` header
  - Read byte-by-byte until the full response body is received
  - Avoid endless loops by checking the return value of `recv()`

http://docs.python.org/3/howto/sockets.html
Implement a utility that queries OCSP for certificate validity:

$ ./ocsp_check.py valid.pem
[+] URL of OCSP responder: http://aia.sk.ee/esteid2018
[+] Downloading issuer certificate from: http://c.sk.ee/esteid2018.der.crt
[+] Querying OCSP for serial: 132457411991227041950906933396399710966
[+] Connecting to aia.sk.ee...
[+] OCSP producedAt: 2020-03-23 16:36:40
[+] OCSP thisUpdate: 2020-03-23 16:36:40
[+] OCSP status: good

$ ./ocsp_check.py revoked.pem
[+] Downloading issuer certificate from: http://c.sk.ee/ESTEID-SK_2015.der.crt
[+] Querying OCSP for serial: 165400448864000643393593611773932020928
[+] Connecting to aia.sk.ee...
[+] OCSP producedAt: 2020-03-23 16:36:44
[+] OCSP thisUpdate: 2020-03-23 16:36:44
[+] OCSP status: revoked
Task: OCSP checker

- Extract OCSP responder’s URL and CA certificate URL from certificate’s Authority Information Access (AIA) extension
- Send HTTP requests using Python sockets (the correct way!)
- Use `urlparse` for easy URL parsing:
  ```python
  >>> from urllib.parse import urlparse
  >>> urlparse("http://example.com/abc")
  ParseResult(scheme='http', netloc='example.com', path='/abc', params='', query='', fragment='')
  >>> urlparse.urlparse("http://example.com/abc").netloc
  'example.com'
  ```
- Use regular expression to get length of HTTP response body:
  ```python
  >>> import re
  >>> re.search('content-length:\s*(\d+)\s', header.decode(), re.S+re.I).group(1)
  ```
- Construct OCSP request using your ASN.1 DER encoder
- OCSP response parsing code is in the template
- Signature verification checks can be skipped
Task: OCSP checker

- OCSP request must include "Content-Type: application/ocsp-request"
- aia.sk.ee returns "revoked" for unrecognized CertIDs
- dumpasn1 fails to decode OCSP request
  - use openssl asn1parse
- OCSP request for valid.pem:

  ```
  $ openssl asn1parse -inform der -in valid.pem_ocsp_req
  0:d=0  h1=2  l= 81 cons: SEQUENCE
  2:d=1  h1=2  l= 79 cons: SEQUENCE
  4:d=2  h1=2  l= 77 cons: SEQUENCE
  6:d=3  h1=2  l= 75 cons: SEQUENCE
  8:d=4  h1=2  l= 73 cons: SEQUENCE
  10:d=5 h1=2  l=  9 cons: SEQUENCE
  12:d=6 h1=2  l=  5 prim: OBJECT :sha1
  19:d=6 h1=2  l=  0 prim: NULL
  21:d=5 h1=2  l= 20 prim: OCTET STRING [HEX DUMP]:455DBEF01E1E2B1058EF1F969918A80708A62182
  43:d=5 h1=2  l= 20 prim: OCTET STRING [HEX DUMP]:D9AC70DB5F7EBE94F8A0E4BE47A2D034AD9A2A12
  65:d=5 h1=2  l= 16 prim: INTEGER :63A65E9ED37BF0115C2C8928DF0FE2F6
  ```
Comments

Wrong way to download HTTP response body:

- Reading the response in one go (wrong!):
  ```python
  body = s.recv(content_length)
  ```
  
  "The receive calls normally return any data available, up to the requested amount, rather than waiting for receipt of the full amount requested." (man page recv section 2)

- Reading until the socket is closed (wrong!):
  ```python
  body = b''
  buf = s.recv(1024)
  while len(buf):
      buf = s.recv(1024)
      body+= buf
  ```

After sending a response, an HTTP/1.1 server will wait for more request/response exchanges, unless header "Connection: close" was specified by the client. Therefore `s.recv()` will hang until the timeout configured by the server is reached.
